Under the simple recovery model, the file must belong to a read-only filegroup.

Under the full or bulk-logged recovery model, before you can restore files, you must back

up the active transaction log (known as the tail of the log).

For more information, see Back

Up a Transaction Log (SQL Server).

To restore a database that is encrypted, you must have access to the certificate or

asymmetric key that was used to encrypt the database. Without the certificate or

asymmetric key, the database cannot be restored. As a result, the certificate that is used to

encrypt the database encryption key must be retained as long as the backup is needed.

For more information, see SQL Server Certificates and Asymmetric Keys.
