Answer: C
Explanation:
Explanation
Amazon CloudWatch alarms watch a single metric over a time
period that the user specifies and performs one or more actions
based on the value of the metric relative to a given threshold
over a number of time periods.
The user can setup an action which stops the instances when
their CPU utilization is below a certain threshold for a
certain period of time. The EC2 action can either terminate or
stop the instance as part of the EC2 action.
If the IAM user has read/write permissions for Amazon
CloudWatch but not for Amazon EC2, he can still create an
alarm.
However, the stop or terminate actions will not be performed on
the Amazon EC2 instance.
